The USGS has been making false estimates re petroleum for years. Three trillion barrels is probably a gross underestimate. Of course the vendors will jack up the price. Solar is not too far off from having a very serious impact on energy use. Petroleum will become a source of lubricants and other chemicals only. Look into methane hydrate. Now estimated reserves to be over four times of all petroleum consumed since the onset of the industrial revolution. Major sources off of Vancouver and South Carolina. As well as Alaska and Gulf of Mexico.
